Dear Hiring Manager,

I'm a Senior Software Engineer with 7+ years building and maintaining backend systems, and I'm writing to express my interest in a senior Laravel / PHP engineering role on your team. I've delivered production Laravel applications end-to-end – schema design, Eloquent, queues and service providers, Blade, RBAC, and deployment tooling – alongside a primary career in Java / Spring Boot microservices for high-throughput fintech, so I bring both Laravel fluency and the reliability discipline that comes from systems where downtime is measured in lost transactions.

On the Laravel side, I built Aerotia International's public platform end-to-end: a Laravel 12 (PHP 8.2) JSON API and Blade admin CMS paired with a React/TypeScript frontend. I built Aerotia Accounting, a Laravel 9 ledger and accounting portal with full CRUD, dashboards, and admin-user management on a Dockerized stack (MySQL, Mailpit, Adminer); the Laravel backend for PREVENTO, a healthcare Android app on Google Play with personalized care plans and doctor–patient messaging over MySQL, AWS, and Firebase; modular Laravel RBAC drop-in modules for an HRMS; and government systems including an Annual Confidential Report generator for the Ministry of ICT. I also author and maintain **laravel-gitstamp**, an open-source Composer package that is MIT-licensed and CI-tested across Laravel 10–12 – so I keep real Laravel code green in CI, not just running locally.

The scale and reliability instincts come from fintech. At Exabyting I work as an augmented resource on bKash Limited's core payment platform – Bangladesh's #1 mobile financial service – building and maintaining queue- and job-centric backend services (Customer App MW, FinRec, PIN Reset MW) that process 2.5M+ transactions daily. I designed and solo-built a self-contained TPS-limiting service with interval-based retry that eliminated HTTP 429 rate-limit failures against a third-party API, later making it dynamically configurable so it could scale to power airtime recharge automation – the kind of resilience work that matters when data ingestion from external APIs is business-critical. I led a framework major-version migration across live services with zero downtime, and I lean on observability and log tooling to track and debug systems after they ship.

On how I work: I use agentic coding tools (Claude Code, Cursor) day to day in real production codebases, and I treat the review step as the real work – I don't ship code I can't explain. I've worked fully remote and async before, extending an open-source IoT platform into multi-tenant middleware for a Swiss enterprise client at SELISE, including direct client-facing discussions across timezones. Outside client work I build and ship things I actually use – a RAG pipeline over S3 documents, and an npm chat-widget package that powers the AI assistant on my own portfolio – because I care about finishing what I start and about code that holds up once real users depend on it.

I'd welcome the chance to discuss how my Laravel and backend experience could contribute to your team. Thank you for your time and consideration.

Sincerely,

Towfiqul Islam
